Detail Introduction :

Product ingredients:

| | |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nicotine | Nicotine is the main active ingredient in chewable nicotine products and is also a neurostimulant. It is a substance that causes nicotine dependence and mimics the effects of nicotine inhaled when smoking. The concentration of nicotine varies from product to product and is usually stated in milligrams (mg). |
| Glycerin | Glycerin is a clear, colorless liquid commonly used to improve the taste of chewable nicotine products. It has moisturizing properties and helps prevent over-drying of the product. |
| Food Flavorings | Chewable nicotine products are often added with food flavors to improve their taste. These flavorings can be provided in various flavors, such as mint, fruit, coffee, etc., to meet the user's taste preferences. |

The main uses of Chewable nicotine include:

Nicotine Replacements: For smokers, they are an alternative to traditional cigarettes, providing nicotine without inhaling harmful smoke.

Nicotine Relief: Used to manage nicotine withdrawal symptoms such as tobacco cravings and anxiety.

Smoking reduction: Help smokers gradually reduce the amount of cigarettes they smoke to achieve the transition to quit smoking.

Smoking aids: During the quitting process, they can reduce withdrawal symptoms and help maintain your determination to quit.

Chewable nicotine products have the following characteristics:

Smoke-free Properties: These products deliver nicotine through oral consumption, so no smoking is required and no smoke or tar is produced. This helps reduce the health risks associated with smoking.

Convenience: Chewable nicotine products are very easy to carry and use. They are suitable for use in a variety of situations, including work, social events and travel.

Taste and Flavor: These products usually come in a variety of flavors, such as mint, fruit, coffee, etc.,

to provide more choices and make the usage experience more pleasant.

Nicotine Control: A variety of nicotine strengths are available, allowing users to better control their nicotine intake, thereby gradually reducing dependence.

Discreetness: The use of Chewable nicotine usually does not attract attention from others because they do not produce smoke or strong odor.

It is important to note that while chewable nicotine products provide an alternative to smoking, nicotine is still an addictive substance. Therefore, users should use caution, follow product instructions, and consult a medical professional when needed, especially during smoking cessation or nicotine dependence management.
